ABOUT

Quest for the Cure was created with one clear purpose: to bring the journey of cancer research to life in a way that is engaging, accessible, and deeply human. Behind every breakthrough are countless individuals—patients, caregivers, physicians, researchers, and advocates—each playing a vital role in moving progress forward.

This interactive experience invites you to step into those roles, offering a glimpse into the decisions, challenges, and moments of hope that shape the path from discovery to treatment. Through shared perspectives, Quest for the Cure highlights how collaboration fuels innovation and how every voice matters in the pursuit of better outcomes.

Because the future of cancer care isn't built by one person alone—it's a collective journey, driven by curiosity, compassion, and a commitment to finding a cure.

INSTRUCTIONS

GETTING STARTED

Start by selecting how many players you have. Choose up to four players.

Next, choose your character:

When you enter the game, you will be automatically assigned one of the following roles:

- Patient
- Caregiver
- Physician
- Research Coordinator
- Safety & Ethics
- Community Advocate

You will take on different roles as you advance through each stage of cancer research:

Discovery, Preclinical, Trials, and Approval.

BEGINNING THE JOURNEY

Start at the beginning of the research pathway—the Discovery stage.

Single Player: Spin the wheel to determine how many spaces you will move.

Multiplayer: Each player spins the wheel to set turn order, then spins again to determine how many spaces to move.

NAVIGATING THE BOARD

You'll notice a variety of colored spaces on the game board. Here's a breakdown of what each means:

**Trivia question:**

Answer a multiple choice or true/false question based on your role and game stage.

**Mini game:**

Complete the mini game for the current game stage.

**Required trivia question:**

Must answer a multiple choice or true/false question correctly to advance!

**Required mini game:**

Must complete the mini game successfully to advance!

No action required.

MINI GAMES

Mini games are unique to each stage of the game and involve short, interactive challenges designed to reflect real-world steps in cancer research.

Molecule Mayhem: As molecules appear, click and drag them to the correct tube — 🧪 molecules can go in any tube, but make sure you throw away 🗑️ molecules!

Toxicology Report: Find and click the test tube without 🦋. Then, click when the dose reaches the highlighted zone on the syringe. A 🐕 means something is incorrect—a 🐕 means you got it right!

Side Effect Search: Find and click on participants having side effects 🧑. As the group grows, fewer participants are affected. You'll complete three rounds.

Treatment Checkup: Review as many reports as you can. Based on the side effect score, dosage, and study results, you must decide if the treatment is **APPROVED** or **DENIED**.

RESOURCES

ADVANCING THE CURE

Quest for the Cure is not about competition. It's about understanding the entire research process. You "win" by:

Gaining a deeper understanding of the people and processes behind research

Engaging in meaningful discussion about clinical trials with friends and family

RESEARCH STAGES

Discovery: Scientists work in the lab to design and identify new medicines that might help stop or slow a disease like cancer.

Preclinical: Scientists test a new treatment in the lab and in animals to better understand how it works and whether it is safe and ready to move forward to clinical trials.

Trials: A promising new treatment is tested in people to learn how safe it is, how well it works, and what side effects it may cause. Trials are conducted in four phases:

Phase I: Tests in a small group of people to assess safety & dosage

Phase II: Tests in a larger group of people to assess safety & efficacy

Phase III: Tests whether new treatment is more effective than standard treatment

Phase IV: Monitors long-term safety & efficacy after approval

Approval: Experts review the results of a trial to decide if a new treatment is safe and effective enough to be approved for wider use; once approved, researchers continue to monitor the new treatment for long-term safety.

KEY TERMS

Clinical trial: A research study that tests new treatments or approaches in people

Efficacy: How well a treatment works under controlled conditions (like in a clinical trial)

Eligibility criteria: The requirements that determine who can or cannot join a clinical trial

FDA Approval: Authorization from the U.S. Food and Drug Administration that a treatment is safe and effective for widespread use

Informed consent: The process of learning about a study and agreeing to participate, with full understanding of risks and benefits

Institutional Review Board (IRB): A group that reviews studies to ensure they are safe and ethical

Principal Investigator (PI): The lead researcher responsible for running the study

Protocol: The detailed plan for how a clinical trial is conducted

Research Coordinator: A member of the research team who helps manage the study, supports participants, and makes sure everything runs smoothly according to the plan

Standard of care: The current best-known treatment that doctors commonly use

END LUNG CANCER NOW

Created by End Lung Cancer Now, an initiative of the IU Simon Comprehensive Cancer Center, in partnership with game developer Ethan Walsh of Starbit Studio, this interactive game reimagines how we learn about cancer research.

Through an engaging, story-driven experience, players explore clinical trials and the many roles that move research forward—building curiosity, understanding, and confidence along the way.

This project is the result of a collaborative effort among cancer advocates, community members, and oncology professionals.
